

Electrochemistry Reactions

S.E. Van Bramer, March 14, 1995

Values from Bard, A.; Faulkner, L. *Electrochemical Methods*; Wiley: New York, 1980

Constants

F = 96484.6 C/equiv
R = 8.31441 J Mol⁻¹ K⁻¹

Nernst Equation

ox + n e⁻ <-> red

aA + bB + ne⁻ <-> cC + dD

$$E_{cell} = E_o + \frac{RT}{nF} \ln\left(\frac{[ox]}{[red]}\right)$$

$$E_{cell} = E_o - \frac{RT}{nF} \ln\left(\frac{[C]^c [D]^d}{[A]^a [B]^b}\right)$$

$E_{cell} = E_{cathode} - E_{anode}$
using reduction potentials

Comments

F₂ is the strongest oxidizing agent

NOTE: Remember that these reactions are all equilibrium reactions. They may go forward (reduction) or backwards (oxidation). Depending upon the other redox pair present.

Li⁺ is weakest oxidizing agent

Trends

Spontaneous reaction is forward (Reduction) for the Redox couple (half reaction) with more positive E°.

Applied potential positive of E° pulls e⁻'s off and causes oxidation.

Applied potential negative of E° pushes e⁻'s on and causes reduction.

Spontaneous reaction is reversed (oxidation) for Redox couple (half reaction) with less positive E°
