## Acetic acid titration

Starting with the following solution of acetic acid:

$M := \text{mole} \cdot \text{liter}^{-1}$

$$K_a := 1.79 \cdot 10^{-5} \cdot M$$

$$C_{\text{acid}} := 0.100 \cdot M$$

$$V_{\text{acid}} := 100 \cdot \text{mL}$$

$$\text{mole}_{\text{acid}} := C_{\text{acid}} \cdot V_{\text{acid}} \quad \text{mole}_{\text{acid}} = 0.01 \cdot \text{mole}$$

First Calculate the initial equilibrium and pH according to the reaction

Equilibrium Expression: 
$$K_a = \frac{C_{\text{CH}_3\text{COO}^-} \cdot C_{\text{H}_3\text{O}^+}}{C_{\text{CH}_3\text{COOH}}}$$

Substitute Variables: 
$$K_a = \frac{X \cdot X}{C_{\text{acid}} - X}$$

Substitute Values: 
$$1.79 \cdot 10^{-5} \cdot M = \frac{X^2}{0.100 \cdot M - X}$$

Simplify: 
$$1.79 \cdot 10^{-5} \cdot M = \frac{X^2}{0.100 \cdot M}$$

Rearrange: 
$$X := \sqrt{(1.79 \cdot 10^{-5}) \cdot 0.100 \cdot M^2}$$

Solve: 
$$X = 1.33791 \cdot 10^{-3} \cdot M$$

This gives equilibrium conditions as:

$$C_{\text{CH}_3\text{COOH}} := C_{\text{acid}} - X \quad C_{\text{CH}_3\text{COOH}} = 0.09866 \cdot M$$

$$C_{\text{CH}_3\text{COO}^-} := X \quad C_{\text{CH}_3\text{COO}^-} = 1.33791 \cdot 10^{-3} \cdot M$$

$$C_{\text{H}_3\text{O}^+} := X \quad C_{\text{H}_3\text{O}^+} = 1.33791 \cdot 10^{-3} \cdot M$$

$$\text{pH} := -1 \cdot \log\left(\frac{C_{\text{H}_3\text{O}^+}}{M}\right) \quad \text{pH} = 2.87357$$

$$\text{pOH} := 14 - \text{pH} \quad \text{pOH} = 11.12643$$

## Add a small amount of NaOH.

This shifts the equilibrium from the above system. To solve for the new equilibrium conditions, two steps are required.

First since  $\text{OH}^-$  is a strong base, and acetic acid is the strongest acid available,

This reaction will go to completion so that for:

$$C_{\text{NaOH}} := 0.1 \cdot \text{M}$$

$$V_{\text{NaOH}} := 1 \cdot \text{mL}$$

$$\text{mole}_{\text{NaOH}} := C_{\text{NaOH}} \cdot V_{\text{NaOH}} \quad \text{mole}_{\text{NaOH}} = 1 \cdot 10^{-4} \cdot \text{mole}$$

$$V_{\text{total}} := V_{\text{acid}} + V_{\text{NaOH}} \quad V_{\text{total}} = 0.101 \cdot \text{liter}$$

The new initial, NON-EQUILIBRIUM, conditions for acetic acid and acetate are:

Acetic acid

Acetate ions

$$\text{mole}_{\text{CH}_3\text{COOH}} := \text{mole}_{\text{acid}} - \text{mole}_{\text{NaOH}}$$

$$\text{mole}_{\text{CH}_3\text{COO}^-} := \text{mole}_{\text{NaOH}}$$

$$C_{\text{CH}_3\text{COOH}} := \frac{(\text{mole}_{\text{CH}_3\text{COOH}})}{V_{\text{total}}}$$

$$C_{\text{CH}_3\text{COO}^-} := \frac{(\text{mole}_{\text{CH}_3\text{COO}^-})}{V_{\text{total}}}$$

$$C_{\text{CH}_3\text{COOH}} = 9.802 \cdot 10^{-2} \cdot \text{M}$$

$$C_{\text{CH}_3\text{COO}^-} = 9.90099 \cdot 10^{-4} \cdot \text{M}$$

Based upon these initial concentrations, solve for the equilibrium values, assuming X reacts.

Since the initial concentration of the conjugate base is very small, no assumptions are appropriate:

$$1.79 \cdot 10^{-5} = \frac{(9.901 \cdot 10^{-4} + X) \cdot X}{9.802 \cdot 10^{-2} - X}$$

expands to

$$1.79 \cdot 10^{-5} = \frac{(9.901 \cdot 10^{-4} \cdot X + X^2)}{9.802 \cdot 10^{-2} - X}$$

rearranges to

$$1.79 \cdot 10^{-5} \cdot (9.802 \cdot 10^{-2} - X) - (9.901 \cdot 10^{-4} \cdot X + X^2) = 0$$

simplifies to

$$1.754558 \cdot 10^{-6} - 1.008 \cdot 10^{-3} \cdot X - 1 \cdot X^2 = 0$$

has solution(s)

$$X := \left[ \begin{array}{l} -1.9212416872220489408 \cdot 10^{-3} \\ 9.132416872220489408 \cdot 10^{-4} \end{array} \right]$$

If we had made the assumption that X was small, would it work?

Select the appropriate root:

$$X := 9.1324 \cdot 10^{-4} \cdot M$$

Now from the non-equilibrium concentrations above where:

$$C_{\text{CH}_3\text{COOH}} = 0.09802 \cdot M \qquad C_{\text{CH}_3\text{COO}} = 9.90099 \cdot 10^{-4} \cdot M$$

The equilibrium concentrations (Without the Henderson Hasselbach approximation)

$$\begin{aligned} C_{\text{CH}_3\text{COOH}} &:= C_{\text{CH}_3\text{COOH}} - X & C_{\text{CH}_3\text{COOH}} &= 0.09711 \cdot M \\ C_{\text{CH}_3\text{COO}} &:= C_{\text{CH}_3\text{COO}} + X & C_{\text{CH}_3\text{COO}} &= 1.90334 \cdot 10^{-3} \cdot M \\ C_{\text{H}_3\text{O}} &:= X & C_{\text{H}_3\text{O}} &= 9.1324 \cdot 10^{-4} \cdot M \end{aligned}$$

This gives a pH for the solution:

$$\text{pH} := -\log\left(\frac{C_{\text{H}_3\text{O}}}{M}\right) \qquad \text{pH} = 3.03942$$

$$\text{pOH} := 14 - \text{pH} \qquad \text{pOH} = 10.96058$$

## Add more NaOH.

$$C_{\text{NaOH}} = 0.1 \text{ M}$$

$$V_{\text{NaOH}} := 10 \text{ mL}$$

$$\text{mole}_{\text{NaOH}} := C_{\text{NaOH}} \cdot V_{\text{NaOH}}$$

$$\text{mole}_{\text{NaOH}} = 1 \cdot 10^{-3} \text{ mole}$$

$$V_{\text{total}} := V_{\text{acid}} + V_{\text{NaOH}}$$

$$V_{\text{total}} = 110 \text{ mL}$$

The new initial, NON EQUILIBRIUM, conditions are:

Acetic acid

Acetate ions

$$\text{mole}_{\text{CH}_3\text{COOH}} := \text{mole}_{\text{acid}} - \text{mole}_{\text{NaOH}}$$

$$\text{mole}_{\text{CH}_3\text{COO}^-} := \text{mole}_{\text{NaOH}}$$

$$C_{\text{CH}_3\text{COOH}} := \frac{(\text{mole}_{\text{CH}_3\text{COOH}})}{V_{\text{total}}}$$

$$C_{\text{CH}_3\text{COO}^-} := \frac{(\text{mole}_{\text{CH}_3\text{COO}^-})}{V_{\text{total}}}$$

$$C_{\text{CH}_3\text{COOH}} = 8.1818 \cdot 10^{-2} \text{ M}$$

$$C_{\text{CH}_3\text{COO}^-} = 9.09091 \cdot 10^{-3} \text{ M}$$

Based upon these initial concentrations, solve for the equilibrium values, assuming X reacts:

$$K_a = \frac{(C_{\text{CH}_3\text{COO}^-} + X) \cdot X}{C_{\text{CH}_3\text{COOH}} - X}$$

Assume X is small and simplify:

$$K_a = \frac{C_{\text{CH}_3\text{COO}^-} \cdot X}{C_{\text{CH}_3\text{COOH}}}$$

Rearranges to:

$$X := \frac{K_a}{C_{\text{CH}_3\text{COO}^-}} \cdot C_{\text{CH}_3\text{COOH}}$$

Solve:

$$X = 1.611 \cdot 10^{-4} \text{ M}$$

This gives the following equilibrium concentrations:

$$C_{\text{CH}_3\text{COOH}} := C_{\text{CH}_3\text{COOH}} - X$$

$$C_{\text{CH}_3\text{COOH}} = 0.08166 \text{ M}$$

$$C_{\text{CH}_3\text{COO}^-} := C_{\text{CH}_3\text{COO}^-} + X$$

$$C_{\text{CH}_3\text{COO}^-} = 9.25201 \cdot 10^{-3} \text{ M}$$

$$C_{\text{H}_3\text{O}^+} := X$$

$$C_{\text{H}_3\text{O}^+} = 1.611 \cdot 10^{-4} \text{ M}$$

$$\text{pH} := -\log\left(\frac{C_{\text{H}_3\text{O}^+}}{\text{M}}\right)$$

$$\text{pH} = 3.7929$$

$$\text{pOH} := 14 - \text{pH}$$

$$\text{pOH} = 10.2071$$

Since  $[\text{H}_3\text{O}^+]$  is much smaller than the buffer concentrations, this answer is acceptable.

## Add enough NaOH to use up half of the acetic acid.

$$C_{\text{NaOH}} = 0.1 \cdot \text{M}$$

$$V_{\text{NaOH}} := 50 \cdot \text{mL}$$

$$\text{mole}_{\text{NaOH}} := C_{\text{NaOH}} \cdot V_{\text{NaOH}} \quad \text{mole}_{\text{NaOH}} = 5 \cdot 10^{-3} \cdot \text{mole}$$

$$V_{\text{total}} := V_{\text{acid}} + V_{\text{NaOH}} \quad V_{\text{total}} = 0.15 \cdot \text{liter}$$

The new initial, NON EQUILIBRIUM, conditions are:

Acetic acid

$$\text{mole}_{\text{CH}_3\text{COOH}} := \text{mole}_{\text{acid}} - \text{mole}_{\text{NaOH}}$$

$$C_{\text{CH}_3\text{COOH}} := \frac{(\text{mole}_{\text{CH}_3\text{COOH}})}{V_{\text{total}}}$$

$$C_{\text{CH}_3\text{COOH}} = 3.3333 \cdot 10^{-2} \cdot \text{M}$$

Acetate ions

$$\text{mole}_{\text{CH}_3\text{COO}^-} := \text{mole}_{\text{NaOH}}$$

$$C_{\text{CH}_3\text{COO}^-} := \frac{(\text{mole}_{\text{CH}_3\text{COO}^-})}{V_{\text{total}}}$$

$$C_{\text{CH}_3\text{COO}^-} = 3.3333 \cdot 10^{-2} \cdot \text{M}$$

Based upon these initial concentrations, solve for the equilibrium values, assuming X reacts:

$$K_a = \frac{(C_{\text{CH}_3\text{COO}^-} + X) \cdot X}{C_{\text{CH}_3\text{COOH}} - X}$$

Assume X is small and simplify:

$$K_a = \frac{C_{\text{CH}_3\text{COO}^-} \cdot X}{C_{\text{CH}_3\text{COOH}}}$$

Rearranges to:

$$X := \frac{K_a}{C_{\text{CH}_3\text{COO}^-}} \cdot C_{\text{CH}_3\text{COOH}}$$

Solve:

$$X = 1.79 \cdot 10^{-5} \cdot \text{M}$$

This gives the following equilibrium concentrations:

$$C_{\text{CH}_3\text{COOH}} := C_{\text{CH}_3\text{COOH}} - X \quad C_{\text{CH}_3\text{COOH}} = 0.03332 \cdot \text{M}$$

$$C_{\text{CH}_3\text{COO}^-} := C_{\text{CH}_3\text{COO}^-} + X \quad C_{\text{CH}_3\text{COO}^-} = 0.03335 \cdot \text{M}$$

$$C_{\text{H}_3\text{O}^+} := X \quad C_{\text{H}_3\text{O}^+} = 1.79 \cdot 10^{-5} \cdot \text{M}$$

$$\text{pH} := -\log\left(\frac{C_{\text{H}_3\text{O}^+}}{\text{M}}\right)$$

$$\text{pH} = 4.74715$$

$$\text{pOH} := 14 - \text{pH}$$

$$\text{pOH} = 9.25285$$

Since [H<sub>3</sub>O<sup>+</sup>] is smaller than the buffer concentrations, this answer is acceptable.

## Add more NaOH.

$$C_{\text{NaOH}} := 0.1 \cdot \text{M}$$

$$V_{\text{NaOH}} := 75 \cdot \text{mL}$$

$$\text{mole}_{\text{NaOH}} := C_{\text{NaOH}} \cdot V_{\text{NaOH}} \quad \text{mole}_{\text{NaOH}} = 7.5 \cdot 10^{-3} \cdot \text{mole}$$

$$V_{\text{total}} := V_{\text{acid}} + V_{\text{NaOH}} \quad V_{\text{total}} = 0.175 \cdot \text{liter}$$

The new initial, NON EQUILIBRIUM, conditions are:

Acetic acid

$$\text{mole}_{\text{CH}_3\text{COOH}} := \text{mole}_{\text{acid}} - \text{mole}_{\text{NaOH}}$$

$$C_{\text{CH}_3\text{COOH}} := \frac{(\text{mole}_{\text{CH}_3\text{COOH}})}{V_{\text{total}}}$$

$$C_{\text{CH}_3\text{COOH}} = 1.4286 \cdot 10^{-2} \cdot \text{M}$$

Acetate ions

$$\text{mole}_{\text{CH}_3\text{COO}} := \text{mole}_{\text{NaOH}}$$

$$C_{\text{CH}_3\text{COO}} := \frac{(\text{mole}_{\text{CH}_3\text{COO}})}{V_{\text{total}}}$$

$$C_{\text{CH}_3\text{COO}} = 4.2857 \cdot 10^{-2} \cdot \text{M}$$

Based upon these initial concentrations, solve for the equilibrium values, assuming X reacts:

$$K_a = \frac{(C_{\text{CH}_3\text{COO}} + X) \cdot X}{C_{\text{CH}_3\text{COOH}} - X}$$

Assume X is small and simplify:

$$K_a = \frac{C_{\text{CH}_3\text{COO}} \cdot X}{C_{\text{CH}_3\text{COOH}}}$$

Rearranges to:

$$X := \frac{K_a}{C_{\text{CH}_3\text{COO}}} \cdot C_{\text{CH}_3\text{COOH}}$$

Solve:

$$X = 5.96667 \cdot 10^{-6} \cdot \text{M}$$

This gives the following equilibrium concentrations:

$$C_{\text{CH}_3\text{COOH}} := C_{\text{CH}_3\text{COOH}} - X \quad C_{\text{CH}_3\text{COOH}} = 0.01428 \cdot \text{M}$$

$$C_{\text{CH}_3\text{COO}} := C_{\text{CH}_3\text{COO}} + X \quad C_{\text{CH}_3\text{COO}} = 0.04286 \cdot \text{M}$$

$$C_{\text{H}_3\text{O}} := X \quad C_{\text{H}_3\text{O}} = 5.96667 \cdot 10^{-6} \cdot \text{M}$$

$$\text{pH} := -\log\left(\frac{C_{\text{H}_3\text{O}}}{\text{M}}\right) \quad \text{pH} = 5.22427$$

$$\text{pOH} := 14 - \text{pH} \quad \text{pOH} = 8.77573$$

Since  $[\text{H}_3\text{O}^+]$  is smaller than the buffer concentrations, this answer is acceptable.

## Add enough NaOH to use up all the CH<sub>3</sub>COOH available.

This is the equivalence point for the titration. The major species in the solution is CH<sub>3</sub>COO<sup>-</sup>. Since this is the conjugate base to a weak acid the pH is calculated as for a solution of this base for the reaction:

$$C_{\text{NaOH}} := 0.1 \cdot \text{M}$$

$$V_{\text{NaOH}} := V_{\text{acid}}$$

$$\text{mole}_{\text{NaOH}} := C_{\text{NaOH}} \cdot V_{\text{NaOH}}$$

$$V_{\text{total}} := V_{\text{acid}} + V_{\text{NaOH}}$$

$$V_{\text{NaOH}} = 100 \cdot \text{mL}$$

$$\text{mole}_{\text{NaOH}} = 0.01 \cdot \text{mole}$$

$$V_{\text{total}} = 0.2 \cdot \text{liter}$$

Since the NaOH is a strong base the initial NON-EQUILIBRIUM conditions are:

Acetate ion

$$\text{mole}_{\text{CH}_3\text{COO}^-} := \text{mole}_{\text{NaOH}}$$

$$\text{mole}_{\text{CH}_3\text{COO}^-} = 0.01 \cdot \text{mole}$$

$$C_{\text{CH}_3\text{COO}^-} := \frac{\text{mole}_{\text{acid}}}{V_{\text{total}}}$$

$$C_{\text{CH}_3\text{COO}^-} = 0.05 \cdot \text{M}$$

Acetic acid

$$\text{mole}_{\text{CH}_3\text{COOH}} := \text{mole}_{\text{acid}} - \text{mole}_{\text{NaOH}}$$

$$\text{mole}_{\text{CH}_3\text{COOH}} = 0 \cdot \text{mole}$$

$$C_{\text{CH}_3\text{COOH}} := 0$$

The EQUILIBRIUM expression for this base reaction above is:

$$K_b = \frac{C_{\text{CH}_3\text{COOH}} \cdot C_{\text{OH}^-}}{C_{\text{CH}_3\text{COO}^-}}$$

From the balanced equation, this is:

$$K_b = \frac{X^2}{C_{\text{CH}_3\text{COO}^-} - X}$$

Find K<sub>b</sub>:

Since:

$$K_w = K_b \cdot K_a$$

$$K_w := 1.0 \cdot 10^{-14} \cdot \text{M}^2$$

$$K_a = 1.79 \cdot 10^{-5} \cdot \text{M}$$

Rearrange

$$K_b := \frac{K_w}{K_a}$$

Solve for K<sub>b</sub>

$$K_b = 5.58659 \cdot 10^{-10} \cdot \text{M}$$

Substituting into the equilibrium expression:

$$5.5556 \cdot 10^{-10} \cdot M = \frac{X^2}{0.05 \cdot M - X}$$

Assume that X is small compared to the buffer and the equation rearranges to:

$$X := \sqrt{2.7778 \cdot 10^{-11} \cdot M^2}$$

$$X = 5.27048 \cdot 10^{-6} \cdot M$$

NOTE: without assuming that X is very small the equation solves for X:

$$X := \left[ \begin{array}{l} 5.2702060760763781548 \cdot 10^{-6} \cdot M \\ -5.2707616360763781548 \cdot 10^{-6} \cdot M \end{array} \right]$$

Select the physically meaningful root gives:

$$X := 5.2702060760763781548 \cdot 10^{-6} \cdot M$$

This is identical to the above answer.

This gives equilibrium concentrations as:

$$C_{\text{CH}_3\text{COO}^-} := C_{\text{CH}_3\text{COO}} - X \quad C_{\text{CH}_3\text{COO}} = 0.04999 \cdot M$$

$$C_{\text{CH}_3\text{COOH}} := X \quad C_{\text{CH}_3\text{COOH}} = 5.27021 \cdot 10^{-6} \cdot M$$

$$C_{\text{OH}^-} := X \quad C_{\text{OH}^-} = 5.27021 \cdot 10^{-6} \cdot M$$

From this the pOH and pH

$$\text{pOH} := -\log\left(\frac{C_{\text{OH}^-}}{M}\right) \quad \text{pOH} = 5.27817$$

$$\text{pH} := 14 - \text{pOH} \quad \text{pH} = 8.72183$$

Note: the equivalence point for this titration is NOT at pH 7.

## Add excess NaOH.

Since the excess OH<sup>-</sup> is a strong base present it will determine the pH

$$C_{\text{NaOH}} = 0.1 \text{ M}$$

$$V_{\text{NaOH}} := 110 \text{ mL}$$

$$\text{mole}_{\text{NaOH}} := C_{\text{NaOH}} \cdot V_{\text{NaOH}} \quad \text{mole}_{\text{NaOH}} = 0.011 \text{ mole}$$

$$V_{\text{total}} := V_{\text{acid}} + V_{\text{NaOH}} \quad V_{\text{total}} = 0.21 \text{ liter}$$

First OH<sup>-</sup> will convert all the CH<sub>3</sub>COOH to CH<sub>3</sub>COO<sup>-</sup> these initial conditions are:

$$\text{mole}_{\text{CH}_3\text{COOH}} := 0$$

$$\text{mole}_{\text{CH}_3\text{COO}^-} := \text{mole}_{\text{acid}}$$

Calculate the [OH<sup>-</sup>], from the excess OH.

$$\text{mole}_{\text{OH}^-} := \text{mole}_{\text{NaOH}} - \text{mole}_{\text{acid}} \quad \text{mole}_{\text{OH}^-} = 1 \cdot 10^{-3} \text{ mole}$$

$$C_{\text{OH}^-} := \frac{\text{mole}_{\text{OH}^-}}{V_{\text{total}}} \quad C_{\text{OH}^-} = 4.7619 \cdot 10^{-3} \text{ M}$$

Then use this to calculate pOH and pH:

$$\text{pOH} := -\log\left(\frac{C_{\text{OH}^-}}{\text{M}}\right) \quad \text{pOH} = 2.32222$$

$$\text{pH} := 14 - \text{pOH} \quad \text{pH} = 11.67778$$

Finish off with a table of the above results:

mL NaOH added	pH (approximation)	pOH (approximation)
0	2.87	11.13
1	3.04 (2.75)	10.96 (11.25)
10	3.80 (3.79)	10.20 (10.21)
50	4.74 (4.74)	9.25 (9.25)
100	8.72 (8.72)	5.28 (5.28)
110	11.68 (11.68)	2.32 (2.32)
